Module 3 Assignment

 **সংক্ষিপ্ত বিবরণ**

 **Assignment: Clean a Messy Excel File Using n8n**

 **Objective**

Build an **n8n workflow** that automatically cleans a messy Excel file and produces a clean, standardized, and duplicate-free customer dataset.

 **Scenario**

You have received an Excel file from a client containing customer information. The file contains several data-quality issues that must be fixed before it can be used for business operations.

The dataset may contain:

- Empty rows
- Duplicate records
- Inconsistent capitalization
- Extra spaces
- Missing values
- Invalid phone numbers
- Invalid email addresses
- Mixed date formats

 **Sample Data**

Full Name	Email	Phone	City	Registration Date
john doe	john@gmail.com	01712345678	dhaka	01/05/2025
JOHN DOE	john@gmail.com	01712345678	Dhaka	May 1, 2025
Sarah Khan	sarah@gmail	01967654321	Chittagong	2025-05-03
Ahmed Ali	(Missing)	01811111111	DHAKA	03-05-2025

 **Core Tasks**

Step 1 — Import the Excel File

Upload the Excel file into n8n and read all rows from the spreadsheet.

Expected Output:

All records should be available inside the n8n workflow.

Step 2 — Remove Empty Rows

Identify and remove rows where key fields such as **Full Name, Email, or Phone** are completely empty.

Expected Output:

No completely empty records remain.

Step 3 — Trim Extra Spaces

Remove:

- Leading spaces
- Trailing spaces
- Multiple spaces between words

Example:

John Doe → John Doe

Step 4 — Standardize Capitalization

Convert **Full Name** and **City** into proper case.

Example:

john doe → John Doe

DHAKA → Dhaka

DhAkA → Dhaka

Step 5 — Validate Email Addresses

Validate email addresses and remove records containing invalid emails.

Valid:

john@gmail.com

sarah.khan@example.com

Invalid:

john@gmail

john@

Expected Output:

Only records with valid email addresses remain.

Step 6 — Validate Phone Numbers

Keep only valid Bangladeshi mobile numbers that:

- Start with 01
- Contain exactly **11 digits**

Valid:

01712345678

01812345678

Invalid:

1712345678

017123456789

Step 7 — Standardize Dates

Convert all date formats into the standard format: YYYY-MM-DD

Examples:

01/05/2025 → 2025-05-01

May 1, 2025 → 2025-05-01

03-05-2025 → 2025-05-03

Step 8 — Remove Duplicate Records

Identify duplicate customers based on **Email OR Phone Number**.

Keep only the **first occurrence** of each duplicate record.

Expected Output:

No duplicate customers remain.

Step 9 — Create the Clean Dataset

Generate a final dataset with the following structure:

Full Name	Email	Phone	City	Registration Date
-----------	-------	-------	------	-------------------

All records must be:

- Valid
- Consistent
- Properly formatted
- Duplicate-free

Step 10 — Export the Clean File

Export the final cleaned dataset as an Excel file named: `clean_customers.xlsx`

 **Bonus Tasks**

Bonus 1 — Generate Customer ID

Add a new column named **Customer ID** using the following format:

CUST-0001

CUST-0002

CUST-0003

CUST-0004

Bonus 2 — Create a Summary Report

Generate a summary report containing:

- Total Rows Imported
- Empty/Invalid Rows Removed
- Duplicate Rows Removed
- Invalid Emails Removed
- Invalid Phones Removed
- Final Row Count

 **Deliverables for Submission**

Submit the following:

- n8n Workflow JSON file**
- Original Excel File** — the messy dataset used for testing
- Cleaned Excel File** — `clean_customers.xlsx`
- Screenshot of the complete n8n workflow**
- Summary Report** — text format or screenshot
- Screen Recording Video** demonstrating the workflow

 **Success Criteria**

The assignment will be considered successful if:

- All messy data is cleaned correctly.
- Empty records are removed.
- Duplicate records are removed.
- Email addresses are validated.
- Bangladeshi phone numbers are validated.
- Dates are standardized to YYYY-MM-DD.
- Text formatting is consistent.
- The final dataset is duplicate-free and valid.
- The cleaned Excel file is successfully exported as `clean_customers.xlsx`.
- The n8n workflow runs automatically without requiring manual intervention.

 **Final Goal**

Build a **fully automated n8n data-cleaning workflow** that takes a messy Excel file as input and produces a clean, standardized Excel file as output.
